Ag-Analytics

CROP IDENTIFICATION^{BETA}

API Documentation 2021

⤢ API Portal | ⤢ GitHub Repo | ⤢ Jupyter Notebook | ⤢ Purchase

Service Overview

The Ag-Analytics® Crop Identification API timely and accurately determines the spatial distribution, area, and type of crops present on a given field. This beta version uses machine learning models to provide a back-filling crop identification service meaning that it is used for the past years in the field where all the relevant information exists, but the crop type is uncertain.

Model Specifications

The Crop Identification Model, of which the Crop Identification API is based on, takes four main factors into consideration: Location, Weather, Soil information, and Remote Sensing Satellite Imagery/Data. Location, weather, and soil are the three most determining factors in if a given crop will be planted and thrive in a certain area. Remote Sensing Satellite imagery/Data provides near real-time information of a given crop at different developing stages during its growing season.

CROP	AREA (AC)	%
CORN_WET	8.01	2.46 %
WHEAT_HRD_RD_SPR	306.42	94.08 %
SUGARBEET	11.26	3.46 %

CropAI shown in FarmScope

Data Overview

Factor	Variables	Data Retrieval Time	Description
Location	Latitude (resolution 0.0001 ~8m)	N/A	Location is critical in determining the crop type. Farmers in Florida may not plant the same crop as farmers in Minnesota
	Longitude (resolution 0.0001 ~8m)	N/A	
Weather	Growing Degree Days	March, April, May, June, July, August	Monthly growing degree days (GDD) and precipitation data starting from March to August.
	Precipitation		
Soil	National Commodity Crop Productivity Index	N/A	Different crops will thrive on different soil conditions. National Commodity Crop Productivity Index (NCCPI) indicates the productivity of the soil.
	Soil pH	N/A	
Satellite Images	Blue Band	Week of the year: 18-36	Biweekly remote sensing satellite images starting from early May to early September (18 weeks window) from Ag-Analytics® Harmonized Landsat Sentinel service. Bands used in our model Blue, Green, Red, Near Infrared, and two Shortwave Near Infrared bands.
	Green Band		
	Red Band		
	NIR Band		
	SWIR1 Band		
	SWIR2 Band		

POST Request

Request Parameters

Parameter	Data Type	Required?	Default	Options	Description
SHAPE	Geometry, file/text	Yes	--	GeoJSON	Desired area-of-interest.
CropSeason	Text	Yes	--	2013-2019	The year of interest to retrieve the crop type information. Ex. "2018"
ModelType	Text String	No	--	"NN" (Neural Network) "TREE" (Decision Tree)	The type of AI Model to be used.

Header Parameters

content-type:"application/json"

Request Example

POST Response

POST Response Example – application/json

Response Parameters

Parameter	Data Type	Description
feature_averages	Dictionary	Averages of the bi-week remote sensing data and monthly weather data of the area-of-interest: I. **Greenweek#**: Green band value on the # week of the year II. **Blueweek#**: Blue band value on the # week of the year III. **Redweek#**: Red band value on the # week of the year IV. **NIRweek#**: Near Infrared band value on the # week of the year V. **SWIR1week#**: Shortwave Infrared band 1 value on the # week of the year VI. **SWIR2week#**: Shortwave Infrared band 2 value on the # week of the year VII. **GDD#**: Monthly growing degree days VIII. **Precipitation#**: Monthly precipitation
raster_filename	String	URL to use in GET request to retrieve predicted raster file.
rasterinfo	List of Dictionaries	Container for the features and metadata information for the raster.
CellSize	List	Size of a single cell in the raster in degrees. (0.0001, -0.0001) roughly corresponds to an 8 meter by 8-meter square on the Earth's equator.
CoordinateSystem	String	Information about the coordinate system being used for calculations.
Extent	String	Extents of the result raster. Specifies the bottom left and top right corners of the field raster in degrees.
Legend	List of Dictionaries	Legend gives the following details for each range of values: Area: I. **Area**: Area covered II. **AreaUnit**: Unit of Area covered III. **AreaPercent**: Area covered in percentage. IV. **Count**: # of pixels from the result raster in that range V. **CountAllPixels**: Total # of pixels in the result raster VI. **CropID**: Code for the crop identified by model. See Figure 4 VII. **CropName**: Crop name identified by the model VIII. **Color**: Hex color used for the crop type
pngb64	Link	Base64png image of the result raster with legend entries.

GET Request

Request Example

The GET request to retrieve the tif image using the file name from the POST response.

```
https://ag-analytics.azure-api.net/crop-identification-model/?filename= result_
cropidraster_20191126_183736_ 2356.tif
```

Request Parameters

Parameter	Data Type	Required?	Default	Options	Description
filename	text	Yes	--	.tif file	file name returned by POST request

Response Parameters

Parameter	Data Type	Description
file	.tif	Tiff file will be download to the computer of the caller with the name that was used to call the API.
